

Exercise: Importing

Goal

Get comfortable with different ways of importing objects from a package.

How

- Pull the newest commits of the repository.
- Gain access to the `old_kettle` in the `import_package.py` file:
 - import only the `old_kettle` object
 - import all the objects in `ingredients` but nothing else
 - import all the objects in the `brewing` package
- Import the `brewing` package (no specific module, i.e. `import brewing`) in the `importing_package.py` and write `import cooking` in the `__init__.py` file.
 - what do you expect to happen / what do you expect to have access to?
 - and what did actually happen?
- Make sure your `__init__.py` file is empty again. Move your `importing_package.py` file to another directory and run it again to see if it still works. Do not try to fix it, if the importing fails (Spoiler :). Move it
 - into the `brewing` folder
 - into any other folder e.g. the home directory of the laptop
